

Dependency Document

As we are using JSON files for storing our data (student's result and quiz Q&A) there is no dependency on any external database.

Also, the admin password file(admin.txt) is included in the project. So no need to configure anything.

Installation Steps

Just open the folder "Quiz" in Eclipse and run the Launch.java class. It will run the console application.

PS: - As we are not using any external database, everything is linked internally like JSON file for the list of questions and admin password file.[]
